

## Vaporizers Working Logics

A volcano vaporizer combines simplicity of use, a high degree of safety and high efficiency. As during the past few years there has been an increase in sales and a decrease in production so volcano vaporizers are available at easy and good deals. Also there quality has improved from the past times. The process of vaporization or volatilization can be explained as a process which releases the essential, active elements of a substance without burning it. It implements a cutting-edge convection technology which releases just enough heat and air to discharge these vital elements but not enough heat and air to actually combust the material. Any herb which is traditionally smoked may also be vaporized, just as effectively or even more so, without the usual drawback of health risks. Vaporizer represents a safer and healthier alternative to smoking also and that also with three to four times' greater delivery of active ingredients when compared with smoking. Thus we can say that an investment in the Volcano pays for itself in the shortest possible time.

The process of vaporization does not produce smoke, tar and little or no other toxic elements. It is because, unlike combustion, vaporization does not induce substantial denaturing of the substance. If a substance is denatured, its chemical make-up may change when catalyzed by, for example, a flame. As new compounds are created which were not inherent in the plant itself thus we can call it denaturing. One of the main property of vaporization technology is the very fact that vaporization does not substantially alter the compounds being vaporized and does not create any elements that were not originally present in the source material. Till date Volcano Vaporizer can be considered the best in spite of being the more expensive vaporizers on the market. Studies have found that if herb is burnt in the vaporizer, the vaporizer eliminates over 110 chemicals, delivering ninety five percent pure cannabinoids in vapor. Thus these studies showed a substantial reduction that is about ninety nine percent in certain toxins in the vapor as compared to marijuana smoke.

Another reason is that a unique collection system avoids loss by collecting vapor in a special balloon. The volcano vaporizer has bought a revolution in the smoking industry. This smoking cessation device is just as effective when used to vaporize "alternative" herbs as with commonly combusted material like tobacco, if not more so. Herbs represent a safe alternative to the dozens of harmful chemicals found in tobacco. Hundreds of legal, herbal alternatives come from all over the world and are smoked for a variety of ailments and experiences by folks. These herbs can be chamomile, yerba santa, passion flower, ginseng, jasmine, absinthe/wormwood, blue lotus and damiana, among many others, and most can be easily purchased from any living room in the world via the Internet.
