

Making room for an extra guest with an Air bed

Air beds have long since been popular amongst campers and hikers alike. They roll down and fit into almost any backpack and can provide a comfortable night's sleep on even the most robust terrain. But, in recent years, there has been an influx of companies producing fuller sized air beds.

One of the market leaders in larger air bed production is AeroBed who, in 1992, patented a technology which allows the inflation and deflation of an air bed swiftly. The system can fill the bed fully with air within just 60 seconds, while its quick release can have it deflated in just 15. This release is the only way that air can be removed from the bed, meaning you are guaranteed to maintain a high-level of comfort for an unrivalled length of time.

This staggering speed and ease of use make it perfect for those times when you have an extra house guest arrive at short notice. No longer do you have to face the embarrassment of having to place guests (or, less embarrassingly, yourself) on the sofa for an evening.

Aerobeds are made out of strong, durable, material which also makes them an option for those going away on elongated camping trips. The resistant vinyl is safe from most punctures and is designed to withstand extra pressure which may be placed on it. The beds have been tested in an environment which simulates 52 years of activity.

About the Author

Whilst an air bed is never likely to replace traditional [mattresses](#) in the bedroom, they provide a comfortable and quick way of arranging extra guest space at short notice. A range of aerobeds are available at [beds](#) specialists throughout the UK.
